What We Get

This project delivers a complete Hotel Management System that helps manage hotel operations in one centralized platform. It provides separate access and features for different roles such as Admin, Manager, Receptionist, Housekeeping, Maintenance, and Guest. Through this system, hotel staff can handle room management, reservations, check-in/check-out, billing, service requests, and reporting more efficiently. Guests can register, log in, view rooms, make reservations, track booking status, request services, and manage payments. Overall, the project improves workflow, reduces manual work, and makes hotel operations faster, more organized, and more secure.

Project Requirements

The project requires both functional and technical components for successful development.

Functional Requirements

- User authentication and role-based login
- Guest registration
- Admin staff management
- Room creation, update, deletion, and status control
- Reservation creation, modification, cancellation, check-in, and check-out
- Billing and invoice generation
- Partial and full payment support
- Housekeeping task management
- Maintenance request handling
- Guest service requests and feedback
- Reporting and analytics dashboard
- Technical Requirements
- The project uses:
 - Frontend: React.js
 - Backend: Node.js + Express.js
 - Database: MongoDB
 - Authentication: JWT
 - File Uploads: Cloudinary + Multer
 - API Testing: Postman
 - Version Control: Git/GitHub
- The system should also be responsive, secure, and easy to use on different screen sizes.

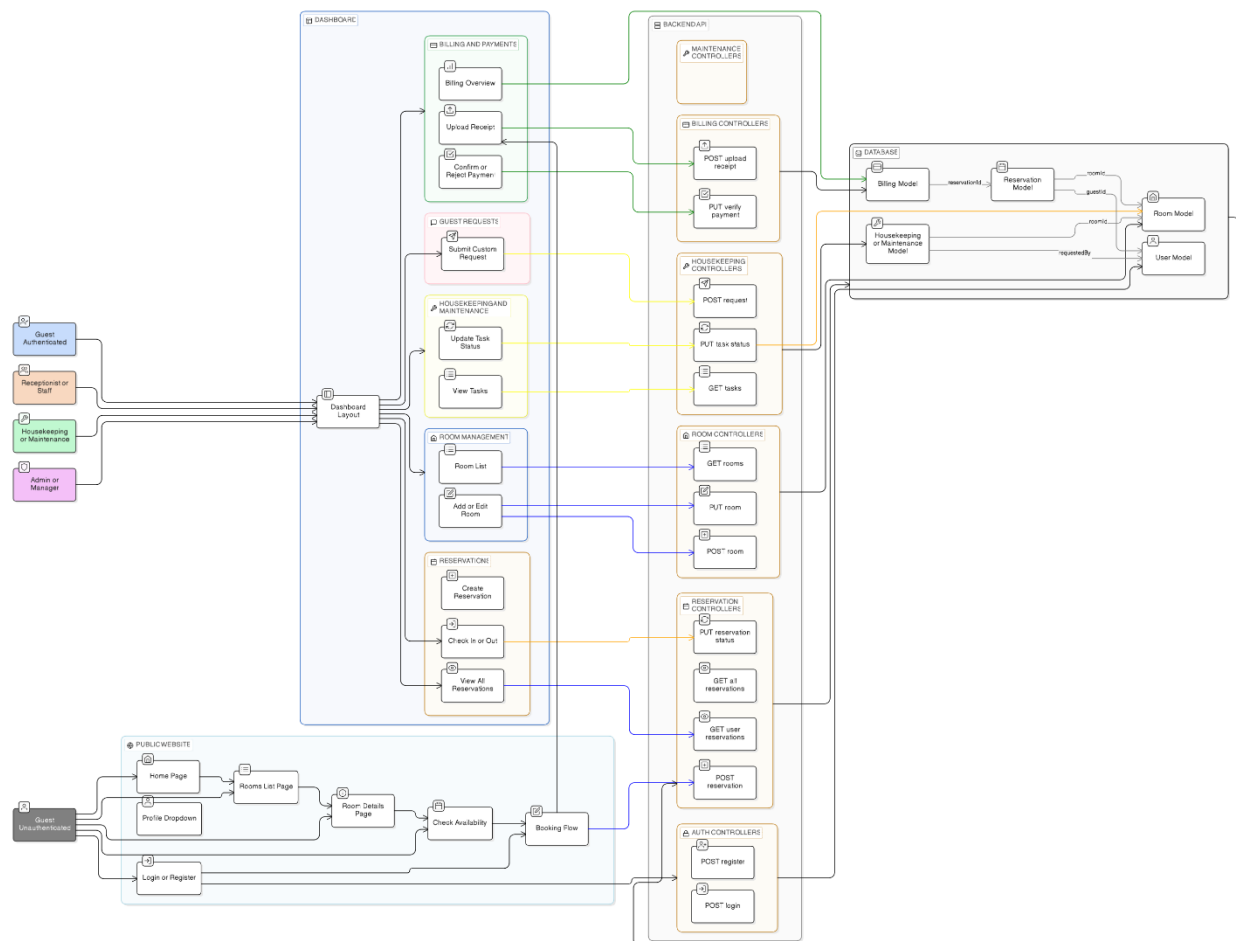

Fixing Gap

During development, some gaps were identified between the required system flow and the implemented modules. These gaps include missing route protection, incomplete module integration, inconsistent dashboard access by role, pending billing improvements, and modules that exist in code but are not yet fully connected in the main server flow. To fix these gaps, role-based protected routes should be properly implemented, each dashboard page should be assigned according to the user's role, billing should fully support receipt upload and payment verification, and all extra modules such as housekeeping, maintenance, and guest services should be mounted and tested in the backend. In addition, frontend and backend flows should remain consistent so that every module works smoothly from UI to database. This project aims to provide a modern and efficient hotel management solution. By completing the requirements and fixing the identified gaps, the system can become a reliable platform for managing hotel activities, improving staff productivity, and enhancing guest experience.

Rooms List

The Room List interface allows users to manage all rooms, including pricing, floor details, gallery images, and room status. It features a sidebar with navigation options and a main content area with a search bar and a table of room details.

#	IMAGE	ROOM NO	TYPE	FLOOR	BASE PRICE	EXTRA BED	CAPACITY	SIZE	BEDS	BED TYPE
#1		100	Deluxe	2	Rs 4000	Rs 11	3	Queen	5	Luxury King
#2		102	Deluxe	2	Rs 4000	Rs 11	4	King	6	Double
#3		101	Standard	1	Rs 5000	Rs 900	2	Small	1	Double
